

## OBJECTS VIDEOCONTROL

### Application examples

IMALeft is a videocontrol system that allows to automatically highlight static changes in the scene (eg. object removed or abandoned) within crowded areas or public zones in need of a careful videosurveillance (eg. railway stations and airports).

The system ignores person or object movements because they represent short variations of the scene compared to the reference image.

**IMALeft is able to alert the attention of the operator only when the situation is potentially dangerous and might be missed due to the complexity of the monitored area or due to the high number of cameras to monitor.**

Public transport

Public and urban areas

Airports and stations

### Features

- immediate visualization and image zooming of the abandoned or removed object
- list of last 6 alarm events
- quick link to playback with necessary pre-registration seconds
- real time alarm notification to all operators and possibility for one of them to take charge of the alarm and signal it.
- creation of an archive that allows a quick and easy search among alarm events.

### Advantages

- effective support to security operator
- management of a high number of cameraa and integration with the system already in place
- robustness to outdoor environments
- easy configuration, installation and use.
